Bulletin # 16-2812 Scarification of Cellular Concrete

Scarification in between lifts of cellular concrete is an un-necessary step that only serves to add additional costs to the project without any real payback in functionality.

Tests performed by the Army Corps of Engineers summarized that “for cellular concrete that will be used as backpacking, the presence of horizontal cold joints does not appear to be a problem area. The benefits of surface roughness are minimal and the as cast surface should suffice” (Technical Report No. 6-763).

For more information, please contact the Aerix Industries technical staff.
